

Reflection – Grading System

Introduction

Short description

We started a project with the goal of creating a grading system. In this system, teachers can create classrooms where they can later add students to create an environment in which the students can access their grades and leave notes for themselves.

Goal

Goal of the program is to create a user-friendly environment in which teachers have the possibility to add their students' grades and leave personal notes for themselves, so they have an easier time keeping an overview of all their students' progress. The students would also have a clear overview of their grades and the possibility to write personal notes so they can easily keep track of their own progress.

Teamwork

Team members and their roles

For the creation of the program, we worked in a team of four in which we divided the workload into the categories "*programming*" and "*documentation*". **Sven** and **Guilherme** were working on the programming part of the project while **Eric** and **Max** were working on the documentation.

How well the collaboration worked

The teamwork worked well. The divided workload gave everybody the ability to work independently in the field they felt the most confident in. This made the work easier for everybody, which resulted in faster workflow.

Although the workflow progressed quickly due to the divided groups, it also impacted on our communication which resulted in more errors in our work and misunderstandings between the teammates. This resulted in chaos, which cost us additional time that we could have used for the overall progress of the system.

Organization

For the organization of the entire project, we used Microsoft Planner to divide the work between the team members and get the approval of them before something gets finalized. For the sharing of the files and documents we used GitHub so everybody could work at the same time without overwriting the work of another member.

Conclusion

Overall, we all believe that dividing the work between the team members so everybody could work on their own independently was a good choice, but we focused so much on getting the program to the next stage, that we forgot how important it is to communicate with each other. This caused setbacks which cost us a lot of time we could have used for our work. In the future we decided to treat communication with the same importance as progressing with our work.
